Interpretation and Limitations

- Device type is an evidence-based estimate from addresses, names, gateways, and common TCP ports; it is not authenticated operating-system identification.
- A second router operating in access-point/bridge mode should appear on the same subnet. A double-NAT router can hide its downstream devices unless this PC has a route and the router permits traffic between subnets.
- Offline, sleeping, firewall-filtered, guest-network-isolated, Wi-Fi client-isolated, or IPv6-only devices may not appear.

Files in this report package: PDF, HTML, CSV device inventory, JSON data, and scan log.
